VMware VCenter Converter Standalone V4.0.1 Portable.11

we have seen a lot of posts over the past weeks and months on the vmware vcenter converter standalone forum. when you run vmware vcenter converter standalone, you are asked to enter a vcenter server url. this url would be the server that is used to manage the vsphere environment. this url should be entered into the url field as seen in the screenshot below. on the next screen, you are provided with a list of virtual machines. you would need to click on the add new virtual machine button to add a new virtual machine. clicking on the add button would open the vmware vcenter converter standalone ui and would open a new virtual machine screen with a tab for the virtual machine that you just created. we also recommend that you check the "take snapshots of this virtual machine" check box as this will provide you with a snapshot of the virtual machine so that you can revert to a previous snapshot if required. once you have added the virtual machine, you need to select a template to create the virtual machine. you would have the option to use a custom virtual machine template or the vmware vcenter converter standalone template. the vmware vcenter converter 5.0.2 downloads a core vmware.com license file from your browser. if you have previously downloaded the software from vmware.com, you will have a valid license file in the downloads/vmware/vcenter.license.txt file, and can use that file to install the software. if you need to download the vmware vcenter converter standalone, please make sure you check the vmware support site for updates for the product and the product download page for the vmware vcenter converter standalone as the links will be updated when the standalone vmware vcenter converter standalone is released. 5ec8ef588b
